

std::runtime\_error

```
classDiagram
    class StringException {
        +StringException()
    }
    class std_runtime_error["std::runtime_error"]
    StringException --|> std_runtime_error
```

The diagram illustrates a class hierarchy. At the bottom is the `StringException` class, which has a public constructor `+ StringException()`. Above it is the `std::runtime_error` class, which is an empty template. A blue arrow with an open triangle head points from `StringException` to `std::runtime_error`, indicating that `StringException` inherits from `std::runtime_error`.

StringException

+ StringException()
